The Lean Hospital: What does it mean?

Kristin Furfari, MD

Outline

- Waste in the US Health Care System
- Lean principles: The Toyota Method
- Application to hospital medicine
- Discharge throughput: A UH example

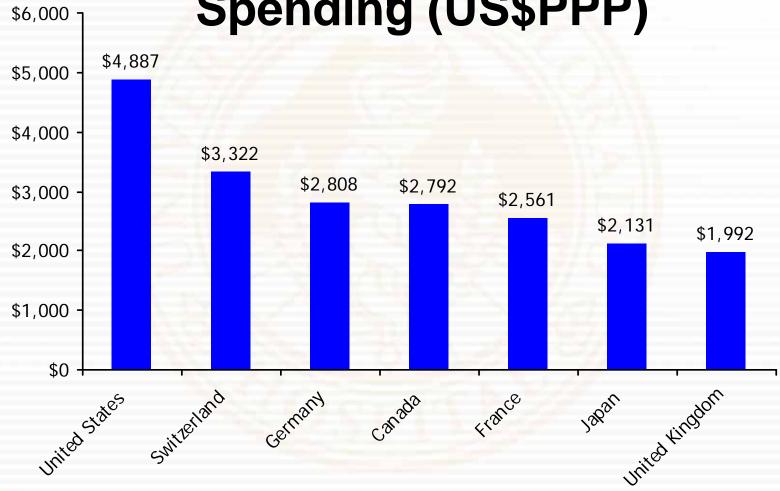

Disclaimers

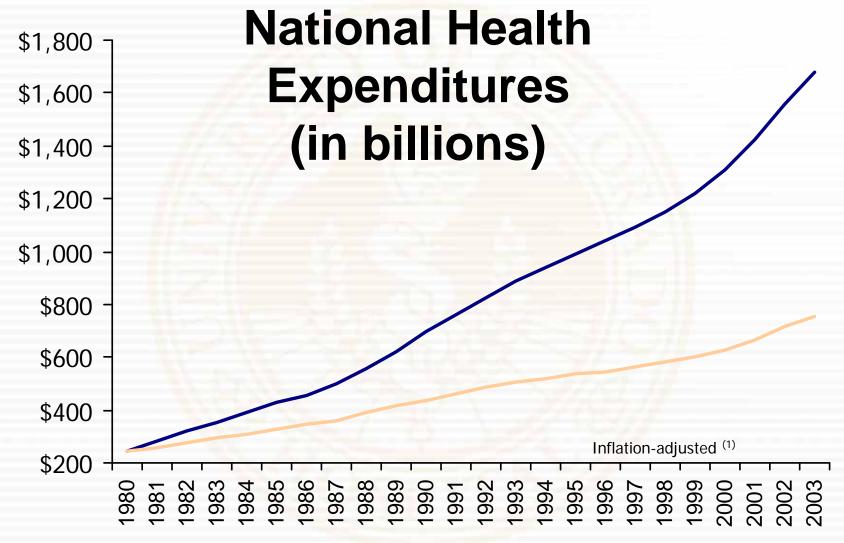

Per Capita Health Care Spending (US\$PPP)

Wasted Time for Hospitalists

Percentage Breakdown of Time

Waste in healthcare

"The national numbers for waste in healthcare are between 30% and 40% but the reality of what we've observed by minute-to-minute observation over the last three years is closer to 60%.... It's everywhere: patient care and non-patient care alike."

The Problem

Too little efficiency

Too much waste

Toyota Production System

- Largest manufacturer in the world
- Eight times more profitable than the industry average
- Produced 40% of the "most reliable" car models on the market in the last decade

Toyota Production System

- Taiichi Ohno: Father of the TPS
- Developed his ideas from observing:

The Indianapolis 500
The River Rouge plant
American supermarkets

Toyota in Healthcare

Creating an environment of stability

Elimination of waste

Rapid identification and correction of errors

What is Lean Thinking?

- A methodology to produce the highest quality product in the shortest amount of time, at the lowest possible cost by eliminating the "seven wastes."
- Fosters a culture which encourages all employees to continually look for improvement

The "Seven Wastes"

- Waste of Overproduction
- Waste of Time (waiting)
- Waste of Product Transport
- Waste in Excess Processing
- Waste in Inventory
- Waste in Movement
- Waste in Producing Defects

The "Seven Wastes"

Waste of overproduction

Separate intern, resident, attending, social services rounding cycles

Entering repetitive information on multiple documents or forms

Waste of time on hand (waiting)
 Primary team waiting for support services
 Patients waiting to make followup appointment
 Delays for bed assignments

Waste of processing

Multiple computer programs to document patient care information

Ordering more diagnostic tests than the diagnosis warrants

Retesting

Waste of stock on hand (inventory)

Duplicate medications and supplies in excess of normal usage

Unnecessary instruments in operating room kits

Obsolete charts, files, equipment, paperwork

Waste in transportation

Primary team traveling to different floors to see patients

Waiting for transportation to arrive to take patient to testing, surgery, discharge

Waste of movement

Nurses leaving patient rooms for common supplies

Searching for charts, patients, medications

Waste of producing defects
 latrogenic illness
 Medication errors

Understanding Value

 Understand value as defined by our customers

Patients, families, payers, regulators Physicians, nurses, hospitals

High-quality, safe, efficient, appropriate

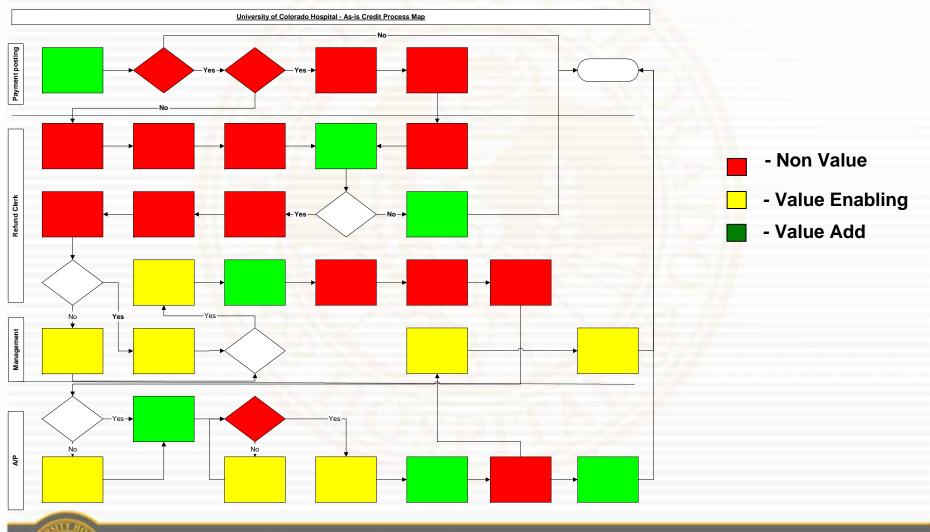

Understanding Value: Lowry Clinic

- Check in at front desk
- Wait in waiting room
- Walk with nurse to assessment room
- Nurse takes vitals
- Walk to exam room
- Wait for physician
- Physician exam

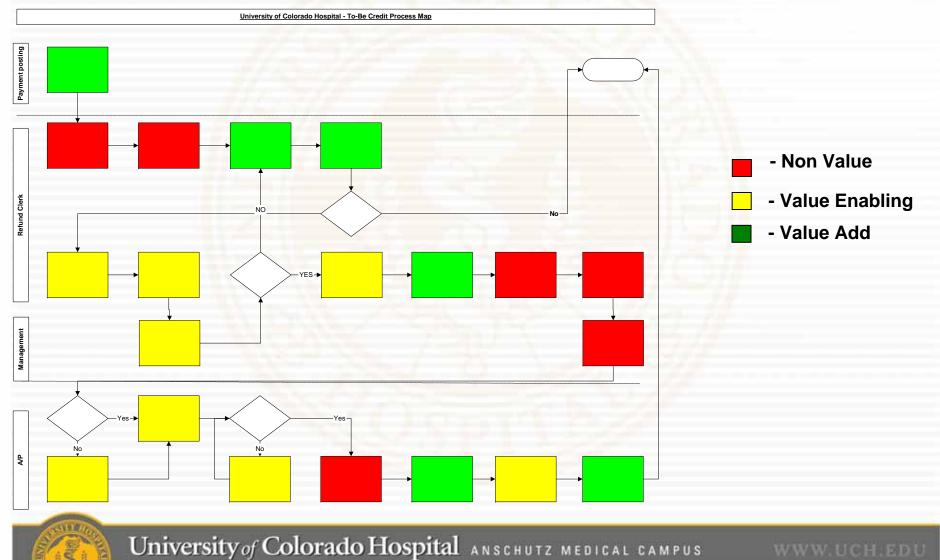

- Wait for physician to return
- Physician consult and treat
- Wait for nurse follow-up
- Walk to laboratory waiting room
- Wait for labs
- Get labs drawn
- Check out

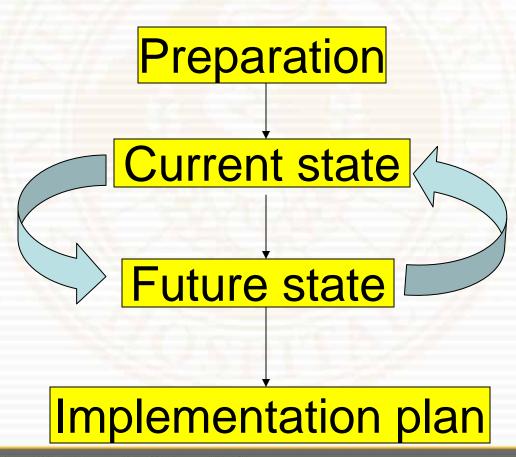

Toyota Production System

Toyota Production System

Process Improvement

Kaizen

Kai: "Take Apart"

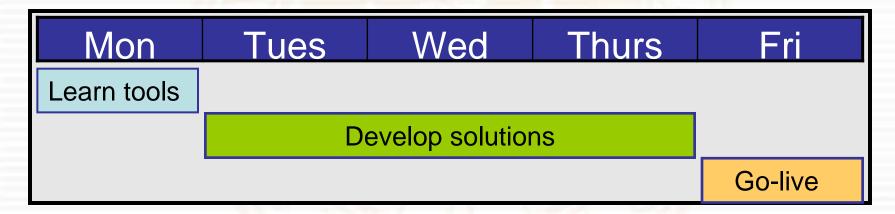

Zen: "Make Good"

The Lean Week

Pre-Lean

Identify, map and measure current process

Lean Week

Post-Lean

Monitor, measure, control, close

Standardization

- Standardization is the basis for continuous improvement and quality
 - Repeatable, stable methods provide a predictable, regular output
 - Creates a safe culture to point out problems and a standard way to fix them

Standard Work

- The technique of achieving consistent performance by creating a consistently applied method of doing a task
- The creation of the method by the people doing the work
- Should lead to continual improvement

University of Colorado Hospital

Standardization

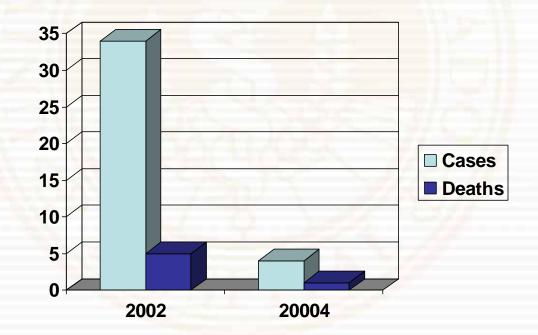

"Today's standardization...is the necessary foundation on which tomorrow's improvements will be based. If you think of standardization as the best you know today but which is to be improved on tomorrow—you get somewhere. But if you think of standards as confining, then progress stops."

Henry Ford, 1921

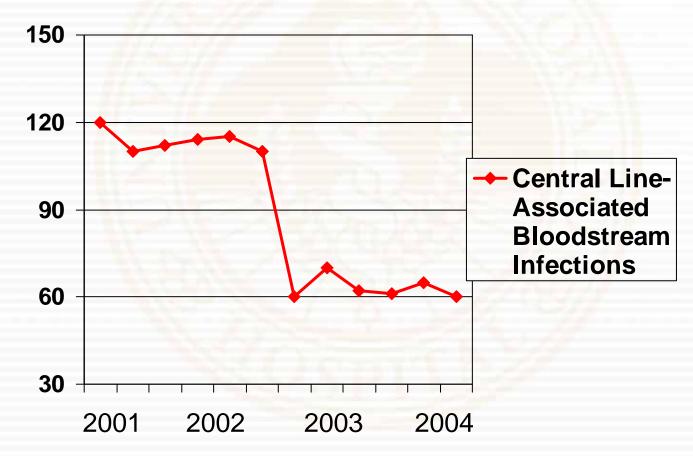

Virginia Mason Medical Center

Ventilator-associated pneumonia

Pittsburgh Regional Healthcare Initiative

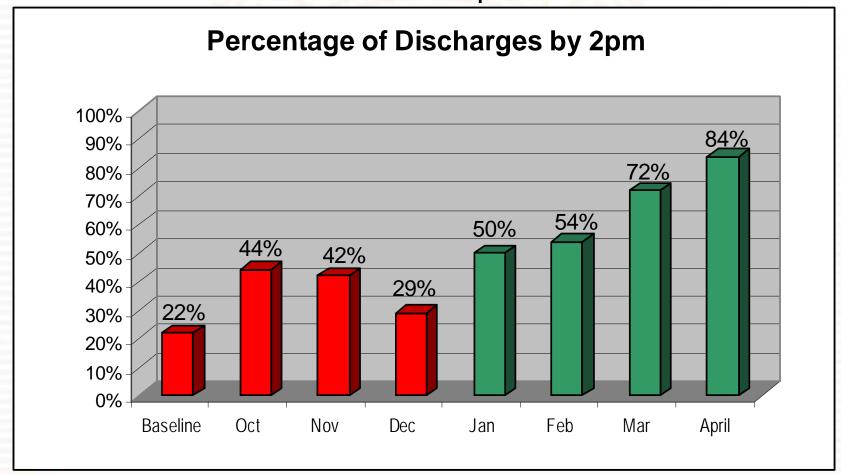

University of Michigan

- PICC lines placed within 24 hours of request:
 - Initially: 50%-70%
 - After Lean: 90%-95%

Overall 36% decrease in average time to placement

12 West Lean Outcome Data

October 2008-April 2009

Opportunities

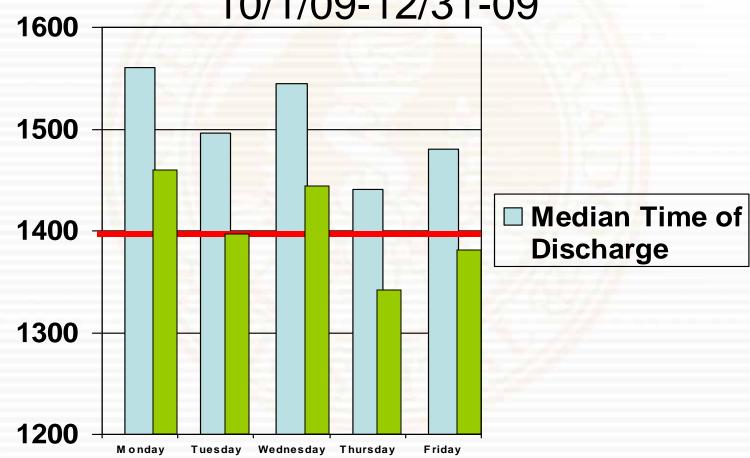

- Identify and reduce waste in the 7E discharge process
- Identify hospital system throughput delays
- Recommend process improvements for hospital-wide discharge process barriers
- Understand how efficiency of the discharge process affects patient satisfaction

Goals

- Reduced time from room empty to room occupied
- Double the percentage "clean to occupied bed time" in less than 60 minutes from 22% to 44%
- Improve daily median discharge time by 1 hour for Monday through Friday discharges
- Create a control plan to monitor and sustain improvements

Baseline Data

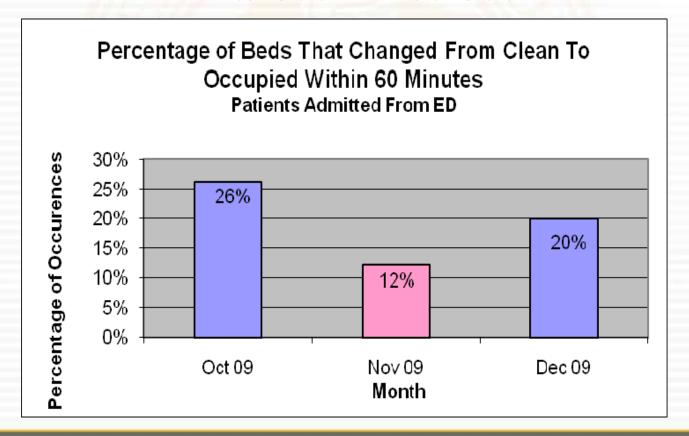

Median Discharge Time by Day of Week: 10/1/09-12/31-09

Baseline Data

Clean to Occupied Bed Time:

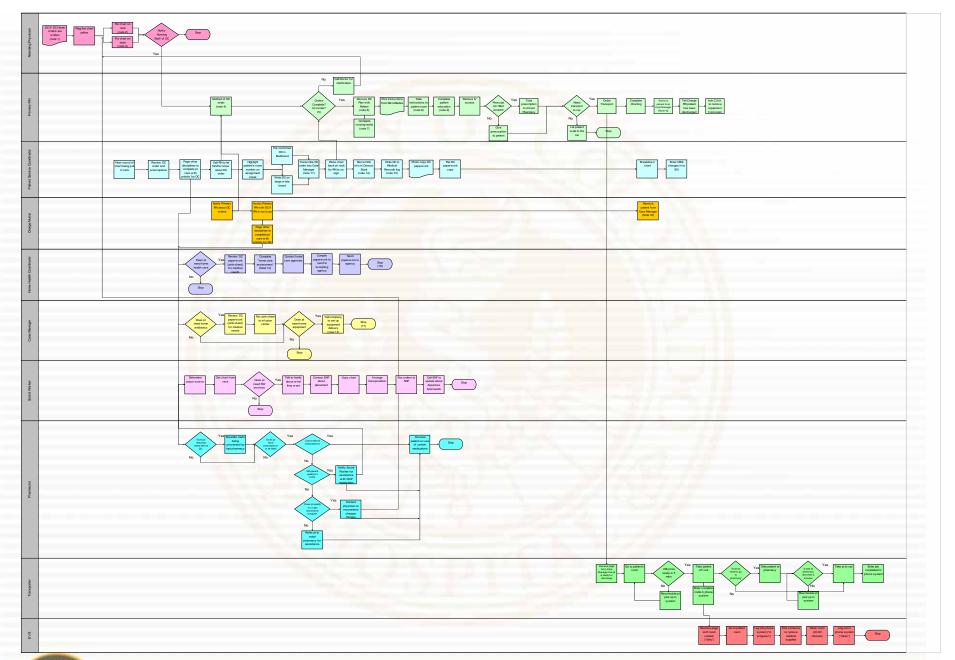

10/1/09 - 12/31/09

Phase II

- Compare staff interview and observation process maps
- Meet with 7E staff to identify wastes in the process and determine Kaizen events
- Implement solutions
- Monitor data compared to baseline/goals
- Create plan for sustainability of project
